From exploration and production to distribution and consumption—new opportunities abound for oil and gas companies to leverage data and real-time analytics to modernize the business and meet voracious global energy demand. Kinetica's instant insight engine makes it possible for oil and gas companies to derive faster insights from vast volumes of streaming data in order to find efficiencies, cut waste, reduce costs, and improve safety.

**STREAMING ANALYTICS ENGINE WITH NATIVE GEOSPATIAL PIPELINE**

Kinetica is the fastest in-memory analytics engine to use GPU acceleration to deliver truly real-time response to queries on large, complex, and streaming data: 100x quicker performance with 1/10 the hardware of traditional databases. Kinetica's geospatial features such as native datatypes, functions, and visualizations make it possible to quickly analyze massive data sets, discover patterns, and uncover hidden insights to optimize the upstream, midstream, and downstream oil and gas processes. Kinetica is enterprise-grade, easy to use, secure, and highly-available. Kinetica runs in data centers or public cloud, and scales out linearly to manage oil and gas data.

**Lightning-Fast Query is Ideal for Real-Time Applications**

Time-sensitive upstream and downstream oil and gas applications such as those for production management, revenue management, distribution, operations, and asset management require real-time analytics on continuously-moving data from sources such as wells, machines, energy grids, and smart meters to discover trends and anomalies and take immediate action. Kinetica takes advantage of GPU's massive parallelization, distributed computing, and in-memory processing to simultaneously ingest, analyze, visualize, and act on fast-moving data to uncover patterns and anomalies, and deliver actionable insights in milliseconds for real-time response. APIs and out-of-the-box connectors for databases, business applications, cloud, mobile apps, and streaming solutions such as Apache Kafka, Apache NiFi, Apache Storm, and Apache Spark enable parallel ingest, analytics, and egress of continuous data streams for low-latency actions and faster time to value.

**Converge AI and BI to do More with Data**

Continuously flowing data far surpasses the ability of humans, manual processes, and legacy systems to store, manage, and act on it timely and cost-effectively. Oil and gas companies need modern, cognitive techniques such as artificial intelligence (AI), machine learning (ML), and deep learning to intelligently, automatically, scalably, and cost-effectively manage, analyze, and act on data. Kinetica's open architecture features analytics with User-Defined Functions (UDFs) to extend functionality with AI, ML, deep learning, and natural language processing. Developers and data scientists can deploy custom code and advanced machine learning libraries such as TensorFlow, Torch, and Caffe natively as GPU-accelerated business logic to power advanced analytics. Automate advanced algorithms or make them accessible to non-technical analysts through SQL and commonly available, click-based, self-service BI and visualization tools to uncover patterns and anomalies and take action.
Why Kinetica?

- **Better performance**: 100X faster performance on 1/10th the hardware
- **Real-time analytics**: Machine Learning, Deep Learning, NLP, OLAP, and custom analytics
- **Native support** for geospatial and time-series data and analytics
- **APIs and connectors** for integration, interoperability, and extensibility
- **Enterprise-grade**: Familiar and standards-based, with security, high-availability, and minimized administration

Large natural gas and electric utility provider uses Kinetica for real-time smart grid infrastructure management

A large utility company with over 10 million customers needed to build agile systems to quickly visualize geospatial elements with faster SLAs for geospatial analytics to manage the health of millions of assets like gas lines, power lines, and power poles. The utility turned to Kinetica to consolidate feeds and layer multiple datasets on the same visualization, fusing analytics. This allows the utility to optimize energy generation, distribution, and uptime, despite fluctuating usage patterns and unpredictable natural disasters.

Kinetica operates as a speed layer for geospatial data to monitor, manage, and predict infrastructure health. Kinetica also powers an interactive view of the health of millions of poles and gas lines located within hazardous environments (fire, snow, and corrosion), identifies failed assets, spatially locates the closest asset in the same asset class, and performs real-time calculations of pole statistics based on real-time map updates.

Geospatial Data and Analytics

Kinetica natively manages time-series and geospatial data such as points, shapes, tracks, and labels and provides out-of-the-box geospatial functions such as filters (by area, by series, by geometry), aggregation (histograms), and geofencing triggers. A rich visualization framework further enables interactive real-time data exploration. The GPU-accelerated rendering of maps and accompanying dashboards facilitates location-based analytics.

Streamline and Simplify

Kinetica’s brute-force compute power from GPUs means less of a need for tuning, indexing data, and even administration. Faster processing leads to simplicity, savings, and ease of use—as well as blazing-fast response. A scale-out architecture and support for cloud, on-premises, and hybrid deployments ensure that Kinetica offers complete flexibility for deploying and managing oil and gas data and analytics applications.

SOLUTIONS FOR OIL AND GAS

Kinetica’s instant insight engine brings together data—in motion and at rest; analytics—machine learning, deep learning, fast OLAP, and geospatial analytics; and compute—GPUs, in-memory, and distributed processing for an easy, fast, and elastic data and analytics system. Kinetica is useful in the following oil and gas applications:

- **Oil and Gas Exploration and Production (Upstream)**
  Oil and gas companies need to leverage real-time pipeline, well, and spatial data to determine the most viable oil fields for exploration, to remotely monitor drilling and production performance, and to avoid hazards and environmental issues. By using Kinetica’s data processing and visualizations, companies can perform a faster and richer analysis of seismic, drilling, and production data to improve geologic analysis, reduce exploration risk, increase drill and production performance, and improve safety and demand forecasting.

- **Energy Service Providers (Midstream)**
  Kinetica’s native data processing and geospatial features make it possible to provide midstream companies, such as energy traders and those that build the vast networks of oil pipelines, with the ability to analyze comprehensive data sets for pipeline oil pressure monitoring, supply/demand forecasting, and real-time visualization of pipeline and trading operations.

- **Smart Meter Analytics (Downstream)**
  Discovering new value from high volumes of streaming IoT data is one of the biggest opportunities in energy today. Energy companies can utilize smart meters to measure how energy resources such as electricity, water, and natural gas are used. Kinetica’s ability to process streaming data and multi-billion row datasets in real time makes it a perfect solution for analyzing smart meter data to optimize energy generation and uptime, predict and prevent power outages, chart energy trends, understand customer energy usage, and improve load forecasts.

- **Equipment, Fleet, and Workforce Management**
  The analysis of streaming data plays a key role in monitoring and maintaining equipment in the energy industry. Oil and gas companies can analyze sensor data from equipment and wells to avoid the downtime, costs, and safety issues that stem from equipment failures. Utilities can analyze electrical transmission, electrical distribution, gas distribution, gas transmission, and power pole data to predict, analyze, and minimize failures. In addition, “breadcrumb data” from maintenance personnel devices and service vehicles can be tracked to find the closest crew to a trouble call, identify the most efficient route, predict vehicle maintenance issues, and reduce emissions.
